

# Fraud Alert Triage Workflow

Evidence-preserving automation for regulated financial workflows: suspicious signal → source evidence → rule explanation → reviewer-ready case note → human-approved next action.

- Synthetic data only
- Decision support
- Human approval required

## What it demonstrates

- Fraud/AML alert review judgment
- Evidence-packet assembly
- Rule contribution explanation
- Reviewer-ready case-note drafting

## What it does not claim

- No real customer, employer, wallet, or client data
- No autonomous account action
- No regulatory sign-off or SAR/KYC decision
- No measured impact claim without evidence

## Reviewer packet

Event timeline, deterministic rule indicators, priority tier, generated case-note draft, and reviewer checklist — all framed as support for human decision-making.

## Role relevance

Fraud / AML / RegTech · Applied AI Ops · AI governance / model risk · FinTech decision support.

## Reviewer-ready case note sample

Priority: high review. A new device and new geography appeared before two low-value transfers to new recipients, followed by a larger transfer attempt. The pattern may indicate account-takeover probing, but this workflow does not declare fraud automatically. Route to human fraud review with event timeline, recipient history, device/session context, and transfer authorization evidence attached.
